

## **Talking Points**

TOPIC: talking about points, lines, & planes — what does your group think?

19)	18)	17)	16)	15)	14)	13)	12)	11)	10)	9)	8)	7)	6)	5)	4)	3)	2)	1)	
There are a number of other points in $\overleftarrow{CG}$ besides C and C.	There are no more than four points in plane ABCD.	A given line cannot be in two planes.	A given point cannot be in ten lines.	A given point can be in two lines. $\blacklozenge$	R, S, T, and X are coplanar.	R, O, S, and W are coplanar.	T, O, and R are collinear. $T$ $S \sim M$	R, O, and S are collinear.	$\overrightarrow{XY}$ intersects plane M at point O (see figure).	Line $XY$ can be denoted as $\overline{XY}$ or $\overline{YX}$ .	Points have no size.	Two intersecting lines meet in exactly one point.	Two planes intersect in a line segment.	Planes have edges.	Collinear points are coplanar.	A plane has no thickness.	Point S is on an infinite number of lines.	$\overrightarrow{PF}$ ends at P.
